EARLY HISTORY OF THE TROWBRIDGE WOOLLEN INDUSTRY

The Wiltshire woollen industry in general and that of Trowbridge in particular were already old and vigorous when the Clark family first appears in its records. During the late fourteenth century, the county lay in the midst of England's most productive area for woollens, which stretched 'from Southampton and Winchester, through Salisbury, across the lower Cotswolds to Bristol and Gloucester '.2 The advantages which Trowbridge itself derived from this excellent industrial location were partly offset by certain deficiencies in the local site from the point of view of textile manufacturing. Old Trowbridge stood largely upon 'a rokky hillet' which was, and still is, half-encircled by the river Biss, a small stream ill-suited to drive water-wheels. This hillock consists of Cornbrash, a shelly, calcareous rock-series through which the Biss here cuts a wide, floodable valley. Early Trowbridge sought the knoll for safety from the floods that afflicted the clays and alluvium round about, and upon it centred many of the routes and much of the marketing activity of the surrounding vale. Yet the town's industrial growth was somewhat hampered by lack of water-power for driving fulling-stocks and of a water-supply soft enough for good scouring.

Fortunately for Trowbridge and for most of Wiltshire, the woollen trade until well into the seventeenth century consisted largely of white. undressed cloths that went to the Continent for finishing. The woollen industry was, in fact, dependent more on organization and capital than on purely geographical advantages for cloth-making. It happened that for the giving out and collecting of raw materials and cloths from and to cottages. Trowbridge had decided advantages. Some of its clothiers had grown wealthy long before the visit of Leland in c. 1538, who noted the benefactions of James Terumber, a very rich clothier, and the buildings erected by John Horton, clothier of the neighbouring town of Bradford. Leland also mentions 'old Bayllie', another local clothier, and his son who 'now drapeth vn the town, and also a 2 miles out of it at a place vn the way to Farley-castel'; and concludes with the fact that 'One Alexandre is now a great clothiar in the town '.3 This Alexander Langford, to give him his full name, rivalled Thomas Yerbury and Thomas Long as the leading clothier of Trowbridge in the mid-sixteenth century.4

¹ I am indebted to Miss G. F. ('Truda') Clark for supplying details of her family incorporated in this introduction and for much assistance with the sections on manufacturing processes, to Mr. R. B. Pugh for helping me to frame the 'Methods of Editing' section and for many other suggestions and to Miss Mary Potter for drawing the Plates.

Thomas Long in 1545 owned nine manors and was assessed for subsidy at £8—or double that of the famous William Stumpe of Malmesbury—while a certain Anthony Passion, who traded much with the Hansards, was asked to pay £7.¹

There is no reliable evidence of early foreign influence on the cloth industry at Trowbridge although about 1580 the Flemish cloth-makers of Seend are said to have moved hither because the Seend water-supply was ferruginous and unsuitable for woollens. Nor is there much reason to expect it, as the white, or unfinished broadcloths sold well abroad except during the temporary upset caused by 'Alderman Cockayne's Project'. The first strong foreign influence appears in the reign of James II when William Brewer of Trowbridge had three Germans or Poles brought to instruct local cloth-workers, with the result that he was soon driving the greatest trade in England for medley cloths.

The influence of foreign wools began to be felt somewhat earlier than that of foreign workers. Spanish merino wool was coming into the West of England by the mid-sixteenth century, but fine medley cloths were not made on any scale in Wiltshire until after 1600. By 1657, Westbury, only three miles to the south, was producing 'broad medley cloths', and two decades later, according to a reliable pamphleteer, the manufacture of Spanish medleys was all done in this corner of Wiltshire and Somerset within a compass of twenty miles, less than one hundred principal clothiers being concerned in it. Bradford and Trowbridge were the great rivals; the one on the Bath Avon with better water for fulling and ampler power for milling, the other having the advantages of a much superior road system with correspondingly better access to the London market. Bradford rose to pre-eminence on broadcloths and heavily-milled fabrics; Trowbridge began to depend more on narrow cloths and medleys, which were usually—but not invariably—dyed in the wool and not in the say or in the piece.

THE EARLY HISTORY OF CLARKS, THE CLOTHIERS

It was against this background of medley cloths, Spanish wools and severe local rivalry that the Clark firm arose. The firm seems to have been established at Trowbridge about 1680, but the connexion between the founder's family and the West Country is probably much older. Certainly the firm ranks with Early's of Witney, Fox's of Wellington and Playne's of Avening as the oldest surviving textile firms of the West of England. Clarks' possess original pattern and batt books which date from the early eighteenth century and form an indisputable commentary on the quality and nature of good-class cloths of the day. Trowbridge and Bradford were at this time the prime centres of the greatest medley-producing region of England, which stretched from Cirencester and Gloucester fifty miles southward to Sherborne in Dorset, and from Devizes twenty miles westward to Bristol. Those two rival towns were the most eminent in the drainage basin of the Bath Avon

¹ P.R.O. Exch. K.R. Subsidies (E179)/197/230; Ramsay, op. cit., 48.

'for the making of fine Spanish cloths, and for the nicest mixtures'. In addition Defoe affirms that the 'finest medley Spanish cloths in the whole world' were made hereabouts, and in spite of his love of superlatives there is no reason to doubt his judgment, as he dealt occasionally with Clarks' of Trowbridge. Although many entries have been lost, the following survive: 'IIth February 1721. I promise to pay to Mr. Daniell Defoe or order £30 three months after date value received as witness my hand. John Allin. Cat in Cornhill'; 'October 22nd 1723. Received of Mr. Daniell Defoe his note of hand two months after date for £54.16.0.'

By this time, the trading connexions of Trowbridge with London were well established and were destined never to be broken, although considerable business was done with merchants at Taunton, Bridgwater, Exeter and Tiverton. 'The clothing of Wilts', as Defoe says, 'comes all by land-carriage to London, and goes down again by land-carriages to all parts of England.'2 There was not, as in the North, that carriage of goods by horse-packs, the Wilts traders being 'gentlemen clothiers', not pedlars'! Among these gentlemen clothiers John Clark (1702-1780)3 was outstanding. On 11th December, 1736, he received through his London Agent, Samuel Vanderplank, 'By bill to his Grace the Duke of Somerset I 1,000.0.0'. But the name of Trowbridge had long been known farther afield than in the ducal homes of England, and on 4th May, 1747, John Clark received through an agent a request from the Empress of Russia for 'plump cloths and good full colours'. John Clark became a kind of merchant adventurer, owned half-shares in ships, and did a considerable trade with Portugal. In 1763, we read 'For 5 pipes of port wine £147.10.0', which together with other entries may be connected with the fact that John Clark, at least for some years, owned a brewery at Frome.4

Two sons of this John Clark much concern us. John Clark, junior, or the Reverend John Clark, as he was always known in later life, greatly extended the woollen business and yet found time to indulge in the fashionable arts. He became a man 'of deep piety, a musician of no mean order, and a fair poet, judged by the standards of the eighteenth century. He was versed in astronomy, and had his own observatory at his residence, Pole Barn House, where also he built and installed an organ'. An eloquent preacher, he was a devout follower of George Whitfield and helped to found and became the first pastor of the

² The Complete English Tradesman (1726), I, 397.

³ The son of William Clark (1664-1735) and Anne Jeffreys.

⁴ The Revd. John Clark was born at Frome Selwood in 1745 but his father soon afterwards moved, first to London and then nine months later to Trowbridge, where he stayed the rest of his life.

⁵ P. J. Goodrich, *Trowbridge* . . . (1932), 167. John Clark bought land from Mr. Hart and built Pole Barn House especially to take his organ, the case of which is in the Victoria and Albert Museum. Perhaps it should be added that his sister, Sarah (who died in 1767) married John Sheppard, a name famous in the cloth industry of Frome.

Tabernacle Church at Trowbridge, a fine, spacious building with an excellent organ. He took up trade and preaching in earnest and most successfully combined the two. As he himself wrote in his *Memoirs*: 'My engaging in trade, for my temporal support, is certainly attended with many advantages. It enables me to preach the gospel without charge; and rendering me independent of the people, it emboldens me to deliver the truth with greater freedom.'

The Revd. John Clark built up a business stretching from Rockley (in Preshute) to Kintbury, Berks (where he had a dye-house on the Kennet), and southward to the many villages in the Avon valley near Trowbridge. He frequently visited London to dispose of his cloth, going sometimes by way of Salisbury and sometimes through Marlborough. Once in 1778, when he set out at 4 a.m., he rode by Tyburn and 'was greatly affected with the sight of two malefactors that were executing'. On his death in 1808, he left fifty guineas to provide interest to be given away in bread annually at Christmas to the poor, 100 guineas towards the erection of an organ in the parish church and £400 in '5 per cent stock the dividends thereof to be annually paid to an organist'. We are more concerned, however, with his legacy of a typical 'domestic' woollen business which employed spinners and weavers over a wide area and had its main tentacles stretching out along the thoroughfares to the metropolis.

The Revd. John Clark's younger brother was christened Joseph in 1748. He early seems to have left Trowbridge for the eastern counties where he apparently acquired a knowledge of cloth-making and married Anne Bayfield of Norwich.³ Some time later Joseph moved to Banbury where he managed his own business in worsted shags or plush. The two brothers kept in close touch with each other by visits and by correspondence, although postage was 2s. 2d. a letter. On 8th December, 1787 Joseph, feeling rather upset by a drunken dyer whom he had dismissed only to find that all the work at a very busy time fell on himself, wrote to his brother John saying how much he wished he could find a site near Trowbridge upon a river with a dye-house or building suitable for a shag manufactory. He could then, he adds, produce shags 20 per cent cheaper than was possible in the Banbury area.4 It happened, however, that Joseph's wish was never fulfilled, for he died prematurely at Banbury in 1793, whereupon the Revd. John Clark had Anne Clark and her two sons brought to Trowbridge and probably housed them in Polebarn Road. It is at this stage in the history of the Clark family that the records printed in the present volume begin.

¹ Memoirs of the late Reverend John Clark . . . published with remarks by William Jay (1810).

² By will of the 7th January, 1802. Benefactions board in Trowbridge parish church.

³ Probably her mother was Ann Plummer and her grandmother Ann Vertigen, who claimed descent from Vortigern. The Clarks still have silver salts with the initials on the three feet: G.P.: A.B.: A.V.

⁴ The letter is being reproduced in full in my forthcoming *The West of England Textile Industries*, where also details of and references to most statements made in this introduction are given. It is one of the two loose letters quoted in this introduction.

THE FORMATION OF ' JOHN AND THOMAS CLARK'

The Revd. John Clark was already well over forty when his two nephews came to live near him. He was wealthy and much interested in spreading the Gospel, especially at the Tabernacle Church. Hence, it is not surprising that he began to hand over to his nephew John (born in 1780) some of the cares of the business. Room, however, had also to be made for Thomas, who was seven years younger, and the uncle eventually made provision for both. On the 5th day of October, 1801, when John had just 'come of age', John the uncle witnessed an Agreement between the two nephews. The articles read as follows:—

'First. It is agreed that the said John Clark shall take to him the said Thomas Clark and employ him in the clothing trade for the space of three years and pay him wages in proportion as other persons in the said trade are paid according to his imployment therein. Also. It is agreed that at the expiration of the said three years that he the said Thomas Clark shall enter in the clothing trade jointly with his said brother John Clark (if they shall so agree) and be intituled to share with him therein the moiety of the sum of £499 now lent by the Revd. John Clark to him the said John Clark his nephew on bond this day entered into. But in case they the said John and Thomas Clark should not agree to carry on the trade together at such time then that he the said John Clark shall pay unto his brother out of the said trade in six months from the said three years the sum of £249.10.0d. either in money or in goods as they shall agree together. Also. The said Thomas Clark doth hereby agree to serve his said brother for the space of three years in the said clothing trade on receiving his wages accordingly as above proposed.'

At the end of the three years stipulated the two brothers entered into partnership together with their mother. John Clark obtained a new series of account books and henceforth kept the accounts in praiseworthy detail, presenting them at the close of each business year to his partners. On 31st December, 1804, the new business proved to be worth £1,762 18s. 4½d. which was apportioned thus: £1,383 15s. 1½d. to John; £300 to Thomas; and £79 3s. 3d. to Mrs. Anne Clark. The main change in ownership occurred in 1813 when on the death of Mrs. Anne Clark her money in the trade—a mere £114 5s. 6d.—was divided equally between John and Thomas.

The following records selected for printing consist of the annual accounts or stock-takings of the Clark woollen business from 31st December, 1804, to the 26th December, 1824, a period of twenty consecutive years during which the assets of the firm rose from just over £1,000 to nearly £50,000. It is, however, well to emphasize that the profits of the old clothing business which had enriched the Revd. John Clark did not pass to his nephews. With typical worldly wisdom he lent them £499 on interest, and left the rest to their industry and sagacity. Consequently, the business with which we are dealing, apart from the great indeterminate advantages of established trading connexions, of an old and excellent reputation and the impetus of a 'going concern', started financially from the beginning. When the Revd. John Clark died in 1808 his nephews

¹ The Agreement is on one sheet of loose paper, foolscap size.

were struggling in a difficult business world while his own son, like himself in his later years, became a cultured 'gentleman'.

John and Thomas Clark took over their uncle's business at a vital Indeed, it is hard to emphasize sufficiently the importance of the early nineteenth century in the history of the woollen trade of the West of England. The clothiers of the Leeds-Bradford area of the West Riding of Yorkshire had flourished abnormally since 1750. Their output of cloths of all kinds had probably equalled that of the West of England by 1790, and within a few decades they were proving serious rivals in all better class fabrics. But the following records will, it is hoped, do much to dispel the mistaken notion that the more enterprising West Country manufacturers could not hold their own. To this theme we shall return later (p. xxxii), for the period in question has many other important facets. Domestic occupations were passing rapidly into factories; elaborate machinery and steam-power were being introduced; clothiers were being displaced by or converted into 'manufacturers', and four out of every five of them were disappearing in the process; German wool was encroaching on Spanish just as superfine cloths were ousting coarser varieties.

Although the Clark records provide a mine of information on all aspects of the woollen industry, in the following pages no more is attempted than to draw attention to some of the features of the trade, for the wish is to leave the records as a quarry for subsequent workers and as a basis on which, should similar records be published for other woollenmanufacturing towns, a wealth of enlightening comparisons may be made.

BASIC RAW MATERIALS

The only raw material which vitally concerns the woollen worker is wool itself, for dyeing is a subsidiary process and as such will be discussed under Processes of Manufacture. The purchase of wool was the first call on the clothier and the provision of the correct qualities his prime care. In the buying of wool by private deal or at public auction the skilled clothier had a great advantage over his less knowledgeable fellows and over those unable to attend in person.

Long before 1800 the Clarks had been dealing almost exclusively in Spanish merino wool which came either to Bristol or to London. These wools were sorted into three main grades: Refina; Fina; and Segunda and/or Tercera, signifying in English, superfine, fine, and moderate or poor. The classification, however, was not empirical; occasionally a bag of good Fina would fetch as much as a poor Refina packed in another region in Spain. The wool arrived in stout bags, each of which when filled weighed I or 2 cwt. Each was stamped with the mark of the Spanish merchant or grower, and John Clark, in his usual artistic way, carefully sketched all these marks in his account books (Plates I and II). Occasionally we read the name of a Spanish supplier, Robles, Corbos, Muñoz and Perez de Soria, a native of the town or province in the bleakest upland in all northern Spain.

¹ See Account of Wool . . . in 1805, 1807 and 1808.

The price of the best Spanish wool fluctuated between 5s. 6d. and 6s. 6d. a lb. from 1804 to 1815, after which it declined steadily, so that by 1824 vast quantities could be had at 3s. 3d. to 3s. 7d. a lb. As was to be expected, the supply was very irregular during the Peninsular war. In June 1808, Napoleon had already gained control of northern Spain and during the next two years the Clarks, like other clothiers, could obtain very little Spanish wool. Portugal was freed of the French in 1810, and within twelve months huge consignments of merino fleeces reached London. One single lot of superfine bought by John Clark consisted of 36 bags holding all told 3,620 lb. which at 5s. 9d. a lb. cost £1,040 15s. This order, however, hardly compares with a single consignment, purchased in 1824, of 99 bags of just over 2 cwt. each, or of 18,766.1b. net, which at 3s. 3d. a lb. cost £3,049 9s. 6d. In this same year fine and poorer quality Spanish wools had dropped in price to less than 2s. a lb.

The great scarcity of foreign wool during the Peninsular war led to a quite unusual demand for English fleeces. Wool was already desperately scarce in mid-summer 1800, when, on 27th August, John Clark wrote to his brother Thomas, who was settling family matters with Gabriel Plummer Bayfield at Magdalen Street, Norwich. John discloses how busy he and other Trowbridge clothiers were in buying local wools. 'I went last Monday and weighed off the Wool, it turns out very well and the weight tolerable. I sorted some of it but thought it best afterwards to get Dix, a regular sorter of Frome, to do it at first. He charges but 10/- a pack of 240 lb. and must do it much better. I have sent yesterday 265 to be scoured of the three first sorts—we thought it best to make but four sorts in the whole. I am going tomorrow to Stratton to weigh his off, but as Norwich affairs are in suspense do not like to buy Pike's . . . ' The advantage of Pike's lot, John Clark continues, would be considerable, but the delay at Norwich and uncertainty of Kendall the cloth merchant 'discounts my plans. Could I have had favourable news from both I might have done some good while out tomorrow, as I may not weigh off and return home the same day. And if I staid there a night I should have went farther about, for the farmers just now are rather frightened about the news. But I am afraid we shall have bad news from the continent and then they will ask higher. James Edgell² has bought Matthews wool at 3/- per lb. He purposes making double milled out of it but I think that will not do so well. . . . I shall get Pike to wait a few days for his answer, if the wool is not sold when I am there.'

In 1810 the Clarks bought much English head wool at 1s. a lb. and paid as high as 4s. 7d. a lb. for some scoured, first prime wool, probably Ryeland. John Clark attended an auction 'by the Candle at Garraway's, Change-alley, Cornhill, on Thursday, 22nd March, 1810, at Five o'clock in the afternoon', and marked off the prices in the margin of the bill of sale. The Spanish wool, although much of it was damaged or repacked, fetched from 4s. 2½d., up to 9s. 7d. a lb., while South Down was sold at

Loose letter:—not copied into Note of Hand Book.

² A leading Trowbridge clothier or manufacturer.

2s. 11½d., Western, and super Sussex at about 2s., and Choice Sussex at 2s. 8½d. During the years 1811 and 1812 the cost of English wools dropped fast and prime locks fetched only 2s. 1d. a lb. By 1813 the Clarks no longer needed to buy appreciable quantities of English wools, their only purchases being coarse white for tags and forrels.

The introduction of German wool is shown very clearly in the accounts. A little German wool had been bought in 1808, but purchases did not begin again until about 1820, when 70 lb. of Saxon cost 7s. od. a lb. The fleeces were well suited to the superfine trade, as they worked easily and made a cloth that handled well. Hence, in 1821, although the price had risen to 8s. a lb., at least 215 lb. were in store. There followed a rapid increase in the purchases and an equally rapid decline in price, In 1822 John Clark devoted a separate section of his accounts to the Saxon wool in store which totalled about 26 cwt, and ranged in value from 3s. to 6s. od. a lb. In the years following, the average price dropped to between 3s. 3d. and 3s. od. a lb. and the Clarks seldom gave above 4s. This wool usually arrived in large bags of about 4 cwt. each, although occasionally the wrappings contained 5 cwt. and sometimes as little as 2 cwt. In December 1824, the wool-house contained 76 unopened bags together holding about 300 cwt. The German wool marks were sketched by John Clark (Plate II), while names—occurring after 1820—such as Schreiber, Hoffman, Schimmelpenning, Christian Fuchs, and Henry Schaaf seem to denote German connexions.

The stock-books also reveal the use, in the lean years 1810-13, of small quantities of cotton, which the Clarks no doubt obtained from Bristol, a city with a small cotton-manufacturing industry. Cotton list, cotton on looms, and cotton in the store-house appear in the records for these years, the value always being 10s. a lb., appreciably more than that of the best wool. It was used in the manufacture of Union cords that were sold, among other purposes, for military uniforms. It appears, too, that the insurance companies carefully watched its use and presumably increased the insurance of the buildings in which it was handled.

One of the effects of the national tax on imported wools can be gleaned from these accounts. Perhaps it is necessary to recall that the great inquiry in 1818 led to a rise (on 10th October, 1819) in the duty on foreign wools from 7s. 11d. a cwt. to 6d. a lb. This exorbitant tax was a great handicap to makers of superfine cloths, while manufacturers producing coarse cloths of English wools—as was common in the West Riding—were quite unaffected by it. On 11th September, 1824, the tax was reduced to 3d. a lb., and on the 19th December following it dropped to 1d. on all imported wools costing over 1s. a lb. and half that amount on cheaper wools. The effect of these deductions is seen in the Clarks' accounts for 1824, when the frequent entries of 'deduct duty at 2d.' reveal apparently that they had bought the wool at a tax of 3d. and with the fall of duty had lost the difference. The duty involved in this fiscal juggling, on the bags lying unopened in store, was £497 13s. 4d.,

¹ S. J. Jones, 'The Cotton Industry of Bristol', in Transactions of Institute of British Geographers (1947), 61-79.

representing nearly 60,000 lb. of wool. Yet there were no complaints, as all western clothiers were glad to see such a burdensome tax dwindle. It is, in fact, no exaggeration to say that the tax, when at 6d. in the lb., cost the Clarks between £6,000 and £9,000 every year.

MANUFACTURING PROCESSES

The general sequence of processes in the manufacture of woollens, summarized from lists compiled in the early nineteenth century, was, and still is, as follows:

SORTING; scouring; DYEING (when dyed in the wool); willying; picking; oiling; scribbling; carding; slubbing; spinning; reeling; warping and sizing; weaving; scouring and dyeing of cloth (if dyed in the say); burling; fulling; scouring of cloth; tenter-drying; raising (or gigging); shearing; dyeing (if dyed in piece); brushing; picking and drawing; pressing; packing.

Sorting

The sorting of wool has always been a skilled task dependent on the knowledge and sense of touch of the individual. The wool-sorter was the best paid of all woollen workers and has never been replaced by machinery. Consequently the Clark records tell little of the process except that in 1810 (in the letter already quoted) a good sorter charged only 10s. for sorting 240 lb. and that the local Wiltshire wool made four sorts. These presumably were short, fine picklocks from the shoulders, prime from the back, seconds from breast and belly, and abb (or long and coarse) from the haunches. After 1814 Clarks' set up a separate sorting shop in which the simple implements included shears for removing fouled staples and skirtings, and casks with wooden partitions to hold the different grades of the fleece.

Scouring

The scouring shop of woollen factories before the coming of modern chemicals was decidedly unsavoury. The yolk, or natural grease, of the staples and the 'suint' or solid residue of perspiration were removed by heating in a mixture of stale urine and 'oil soap'. The cart which collected the urine was sometimes called the 'seg-cart', and the mention, for example, in the Dubbing Shop of 'Sig Tub', refers presumably to the storage of this liquid.²

Dyeing

The Trowbridge clothiers specialized throughout the eighteenth century in medleys and other cloths which were based mainly on Spanish.

¹ See especially Rees, Cyclopaedia (1819) and Ure, Philosophy of Manufacture (1835).

² And also, presumably, the 'Hore Tubs' in the outer warehouse, in for example 1813; in addition 'sig' was used in the dye-house. The use of 'oil soap' is discussed below, pp. xx-xxi.

fleeces dyed in the wool. The Clarks were essentially wool-dyers although in later years cloths were dyed in the piece, that is after finishing. Nothing is heard of say-dyeing whereby the raw cloth straight from the loom is dyed before milling and dressing. The first-named method, dyeing in the wool, was peculiarly suitable to an area where the water was not particularly soft, and might, unless great care was taken, have given uneven shades in the dyeing of a large piece of white cloth.

The contents and utensils of the dye-house seem very typical of the time. Dyestuffs for medley mixtures predominated, the chief colours being reds, browns, yellow, and light blue, but some delightful full-coloured cloths were produced, including various shades of green, olive, purple, blue, and black. Some of the yellows were of an unbelievable excellence.

The main dyestuffs used were rasped and chipped logwood (for browns), brazil wood (for reds), barwood (for brick red), various fustics (for yellow), various madders (for Turkey-reds, pinks, lilac and purple). quercitron bark (for yellow), welds (for yellow)² and sanderswood (for dull red). The more expensive dyestuffs of indigo and cochineal were also used on superfine fabrics. In 1814 the indigo in store (14 lb.) was valued at 15s. a lb. while in the following year the Clarks had two mills for grinding that most permanent of all vegetable blues. About this time a little cochineal appears in the accounts—a few pounds at 42s. a lb.—a costliness which explains the high price and quality of scarlet cloths. is certain, however, that before 1814 most of the dyeing in these high-class full-colours was sent out to public dyers as was the usual practice in the Stroudwater of Gloucestershire. In 1806 and many subsequent years, the Clarks paid considerable sums for dyeing to John Burgess, Strang & Co., Edward Phillips and Peter Anstie, all of the Trowbridge neighbourhood, while in some years Isaac Moore and the local firm of Thomas and Charles Timbrell³ were also well patronized. The sums paid to these public dyers diminished and practically ceased as the cloth output of Clarks' warranted more attention to their own dyehouse, although it must be remembered that both John and Thomas Clark had from their earliest years been associated with a dyeing business.

The accounts reveal the use of sumach, wood wax and various kinds of astergents and mordants, the latter including tin which would presumably be used in the dyeing of cotton. Other dyeing ingredients were ebony—up to a cwt. being in store at times—and orchill, which occurs in 1817 and in small quantities in some later years, and came presumably from the moss-gatherers of Dartmoor.⁴

The Clark business by itself cannot show the remarkable growth of

¹ See, for example, 'Goods resting at Mr. Geo. Kendalls 'in 1806, and 'Piece dyehouse' in 1812.

² Reseda luteola L. or Dyer's Rocket; picked in flower and mixed with woad or indigo to give Saxon Green.

³ Thomas Timbrell acquired the manor of Trowbridge in 1809. Phillips owned a mill at Melksham.

⁴ It was bought by the barrel. See R. Polwhele's History of Devonshire (1797), I, 315-16.

dyeing at Trowbridge in the early nineteenth century. About this time the river Biss suddenly—and somewhat inexplicably—acquired a reputation for dyeing and became possessed of 'a large quantity of various alkaline salts'. Land along its banks sold as factory sites at prices up to 1s. 6d. a square foot, and within a few decades Trowbridge firms, which once had sent cloths outside for dyeing, were dyeing for cloth-makers in nearby towns.¹

Willying, Twillying or Willowing

This process was undertaken in the same shop as the picking and was intended to open out the staples, to free them from sizeable impurities, and to permit the selection of the blends to go forward for spinning. The implements were very simple and comprised little more than a few hurls or hurdles for beating and picking, a few willeys or whilleys, a whaum or two (costing when new only £7), a few stools, and a good supply of large picking baskets. In 1812 the Clarks found it desirable to set up a medley picking shop—for the handling of coloured wools—separate from the white picking shop.

Oiling

Once the scoured wool had been loosened out and blended, it was oiled in order to make it less brittle. The usual variety of oil was Gallipoli but in some years small quantities of Lucca oil were also used. This oil was a constant and not inconsiderable expense. It arrived as a rule in large jars or casks, which in some localities of the West were passed on when empty to public houses for the collection of 'seg'. The casks varied in weight from 8 cwt. to 18 cwt., and in price, during the years 1801-1818, from 8s. to 9s. a gallon or about 11d. to 1s. 2½d. a lb. In 1819 the cost dropped to 8½d. a lb. (or £80 a ton) and thereafter fell steadily to less than 5½d. a lb. (or £50 a ton) in 1824. The firm of Chas. Price & Co. seems to have been the chief supplier.

Scribbling

In scribbling the amount of wool needed for each cloth or batch of cloths was weighed out and was then formed into a loose, continuous fleece. In 1791 an attempt to introduce a scribbler at Bradford led to a do-or-die riot during which the mob seized the machine and burnt it on the bridge over the Avon.² Yet at the turn of the century scribbling machinery had largely displaced hand-work in Wiltshire factories. In 1805 the Clark brothers obtained one half share in a scribbler and two horses and this, presumably with some outside help, met their needs until they introduced steam-power. In 1815 they installed two new 38-inch scribblers (at £130 each complete) and five new 44-inch scribblers (at £150

¹ J. Bodman, Concise History of Trowbridge (1814); R. P. Beckinsale, West of England Textile Industries (in preparation for press); H. R. Exelby, 'The Industrial Revolution in Wiltshire'. Typescript for M.A., University of Bristol, 1925.

² Bath Chronicle, 18th May, 1791. Britton, Beauties . . . Willshire (1801), I, 308.

each), but even these did not suffice for the growing business. In 1816 a 44-inch machine was bought from R. Edgell for £120 and in the following year two new 38-inch machines and a second-hand 50-inch machine—purchased at a Mr. Edward's sale at Freshford—were obtained. In 1818 yet another large scribbler was bought for £150.

Carding

The carding process takes the loose continuous sliver from the scribbler and prepares from it short, narrow strips of loose wool in which the fibres are all arranged more or less lengthwise. Before 1790 in Wiltshire this was done by hand by means of sharp-pointed nails (or staples) driven through leather and fixed to a T-shaped piece of wood, but in that year there was introduced at Bradford the same type of card fixed to the face of a revolving drum. In 1805 Clarks' already had a carding engine (together with a billy, £90) and a horse to drive it. In 1811 a 30-inch carder and billy were bought for £85, while in 1815, two new 32-inch machines were added at a total cost of £180. In 1816 Thomas Rogers supplied a 44-inch carder for £160 and in following years a few extra carders, new and secondhand, were installed. These machines had to be fitted with cards which were obtained from Frome, then one of the greatest card-making centres in Britain. Clarks' always dealt with Rawlings or Gregory, firms which as Rawlings, Gregory & Co., still flourish. The purchases were regular and grew considerably after 1814, probably reaching a peak in 1818, when a bill for £377 14s. was outstanding at the stock-taking.

Slubbing

In slubbing, the short fleecy cardings were joined together and stretched and twisted slightly. This was done with the aid of the billy, which on its introduction into Trowbridge shops soon after 1796 would slub several cardings simultaneously. The frequent mention in the Clark accounts of 'Carding engine and billey' may seem to indicate that the billy was driven either by horse or engine power, but the association was almost certainly not connected with power requirements. At times carders and billies were each purchased separately, and the new 60-spindle billy bought in 1818 would be turned by hand as were spinning jennies. In fact, billies probably continued to be worked by hand until the 1840's. The purchase of a 'twisting mill' (for £15) in 1816 seems connected with the work either of the billy or the jenny, but it was apparently not a success apart from the fact that two years later it was sold at a good profit.

Spinning

The spinning jenny was probably first successfully introduced into Wiltshire about 1789 and was in general use in the county by 1793. A remarkably cheap and efficient machine, it was unrivalled for the

¹ The name Rawlings, Gregory & Co. appears as such in Clarks' accounts for 1812, and in several subsequent years.

spinning of weft yarns for superfine cloths. In 1804 the jennies at Clarks' had from 70 to 90 spindles each, but even the larger type only cost £9. In 1808 these were disposed in three shops and within a few years had overflowed to shops at Nail's and Boswell's. The jennies served the firm well for many years, although no new machines were bought after 1825.¹ Subsequent accounts show that a mule shop was built and the first mules—3 pairs at £172 each—were installed in 1837. These were very economical of space and reduced the cost of spinning firm warps. Of reeling—apart from the purchase of reels—and of warping and sizing, the Clark records say little. Nor was there much to be said. Once the loom was warped and the warp yarns sized with paste to prevent breaking by friction with the passing of the shuttle, weaving could begin.

Weaving

The weaving of cloth in Trowbridge in the early nineteenth century was done in cottages and occasionally in small workshops quite distinct from the factories. The yarn was collected or distributed and the cloth returned to the mill for finishing. The Clarks had no looms on their premises but they rented them out to their weavers. In December 1814, these weavers owed the firm £20 for the loan of looms, while 53 persons also owed small sums, presumably for the same reason. By 1821 about 100 workpeople owed small amounts; and in 1824, when these artisans are definitely stated to be weavers, the number to whom the firm was indebted was 132. At the same time 50 owed money—often less than 10s. Christopher Bailey, however, owed as much as £139 8s. Id., which suggests that he managed a weaving business and probably kept his own loom-shops.² A few of the weavers were women.

The Clark accounts only touch incidentally on the type of loom. The Revd. John Clark's diary tells of the abortive early attempts to introduce the fly-shuttle. Thus on 18th September, 1785 'the weavers were rising round the country and intended to come and destroy all the looms of their masters', and in 1787 'the workpeople' were said to be 'again in a riotous state'. Further riots in 1801-3 postponed the next great effort to introduce the fly-shuttle for at least ten years. In 1812 the Clarks subscribed £37 16s. to the Militia Society and within five years had given £200 more, presumably for the benefit of military protection. Equally significant is their purchase in 1816 of two muskets, two brace of pistols, and a blunderbuss at a total cost of £4 12s. The fly-shuttle seems to have arrived permanently this time, whereas at Bradford—which was more concerned with broadcloths—riots flared up again in 1822. The power-loom was not introduced at Clarks' until shortly before 1861.

The warping of the looms at Trowbridge and the annual output of

¹ Mules were first introduced into Wiltshire about 1828; Reports from Assistant Hand-loom Weavers Commissioners, H.C. [220] 1840, XXIV, 370.

² At the stocktaking of December 1808 Christopher Bayley (weaver) was owed over £59 and William Boulter (weaver) over £341.

cloth by each weaver are known from a government inquiry in 1838.^I In 1810 and for several years later chains were warped 42 yards and contained 2,280 threads, the width on the loom being 42 inches. Subsequently the width was increased to 46 inches and this, together with the use of finer yarn, meant that the shuttle now had to travel (according to Trowbridge weavers) 38 miles, 2 furlongs, 18 poles, I perch farther in a piece of cloth. Since a good weaver threw the shuttle sixty times a minute on narrow work, he would, allowing for breakages, take over 25 hours to weave this extra yarn. Consequently, weavers of narrow cloths were not producing more pieces a year in 1838 than in 1810, whereas the fly-shuttle was proving a great boon to broadcloth weavers who could now weave without an assistant to return the shuttle.

A fine Trowbridge cassimere of 42 yards took nearly three weeks to weave, the work usually going more quickly in summer than in winter. A strong skilled weaver would make just over 20 cloths a year. In 1818 the production by Clarks' of 3161 cloths would on this reckoning need more than 150 looms, while the 4959 cloths made in 1824 would have required about 250 looms. As the accounts show 100 possible weavers in the former year and about 180 in the latter, it seems that many weavers had more than one loom in their homes. Moreover, the parliamentary report of a few years later states clearly that two or more narrow looms a family was common. It should be noticed, however, how large a part Christopher Bailey played in Clarks' weaving affairs from 1804 to 1824. It seems strange that this man continued to work on commission and so, as far as we know, never became a clothier.

The next processes normally undertaken at or for Clarks' were burling, i.e. the removal of rough lesions and knots, and milling, or the fulling and final scouring of the cloth.

Fulling (or tucking) and Scouring

The word 'fulling' does not occur in the Clark records until well after 1824.² The Biss was not strong enough to drive heavy fulling-hammers, and up to 1815 the firm sent its cloths for milling or thickening to Thomas Perkins³ of Iford and to Mary Gordon and John Jones of Bradford. In 1815 Clarks' built a new tucking-house, installed two tuckers (for £33 12s.) and drove them by steam-power. These tuckers appear to have been of the normal fulling-stock type and their influence was soon reflected in the increasing output of milled and double-milled superfines.

The normal method of fulling was to pound the cloth in a thick solution of soft soap and water.⁴ The thickened cloth then had to be

- ¹ Report from Assistant Hand-loom Weavers' Commissioners, H.C. (43(I)) 1840, XXIII, 409, 425-6, 436, 455-6. There were about 1,600 looms in the Trowbridge-Westbury area at this time.
 - ² The firm had three fulling-shops in 1861.
- 3 Thomas Clark married Sarah Perkins. Notice also the firm of Clark & Perkins (p. 133).
- 4 A solution for superfines at Gott's of Leeds was 80 lb. of oil soap to 105½ gallons of water (W. B. Crump, Leeds Woollen Industry, 1880-1820 (1930), 300).

scoured thoroughly of all oil and soap acquired during its manufacture. This scouring usually depended chiefly on soap solutions, an abundance of soft water, fuller's earth if available, and forced rotation by stocks considerably smaller than fulling-stocks. The firm of Clark naturally used large quantities of soft soap, which ranged in price from 1s. 1d. to 1s. 31d. a lb. until 1819, and thereafter dropped steadily to 10d. Their chief supplier was Messrs. Fripp & Co., a famous Bristol firm that supplied oil soap for superfine cloths to Benjamin Gott of Leeds. In and after 1813 soap was also bought from Gordon & Son, John Wilkins, Mullings & Gibbs, and Simon Noad. In December 1818 Clarks' owed Fripp & Co. no less than £787 15s. for soap. Large purchases such as this were inevitable when soap was used for the scouring of wool as well as for the milling of cloth. By way of contrast these same accounts do not mention fuller's earth, which was readily obtainable from the workings just south. of Bath. Yet this excellent scourer of thickened cloths was much used by the millmen in the Avon valley and by the Clarks themselves in later vears.

Tenter-Drying

The milled cloths were then stretched between tenterhooks on the racks to dry. In 1804 the Clarks possessed only one tenter rack, of 42 yards or the normal length of a Trowbridge cassimere, but in the next few years they also rented racks cheaply from James Edgell and a certain Whatley. During the period 1816-18 they re-started and reformed their racking system. One new rack was bought for £13 from James Boucher, another (of $44\frac{1}{2}$ yards) from Edward Rogers, another (of $42\frac{1}{2}$ yards) of Burbage & Stevens, and two others for cassimeres from another dealer. These racks sufficed until 1828-9, when, as later records show, an iron rack was bought new for £27 10s. and four iron racks were bought secondhand at a sale at Freshford for a mere £28, half as much again being spent on iron supports and erection.

Raising

After being taken from the tenters the cloth was subjected to roughing or rowing in which teasels set in wooden cards or hands raised a nap. We are left in no doubt as to the great importance of the 'handle house' and of the 'dubbing shop', in which this process was carried out.²

The presence in the dubbing shop of a set of rollers and two dubbing boards and troughs clearly shows that the Clarks were using a raising machine of the type patented by Thomas Jotham of Bradford in 1801. It dressed or dubbed cloths wet or dry, the cloth being fixed 'like a jack towel' to two end rollers and drawn past two cylinders faced with teasels.³

¹ The Noads, an old Wiltshire family, were at this time in the woollen trade at Farleigh Hungerford, Somerset, and at Littleton Wood Mill, near Semington. The Noads, Gordons and other local people may have fulled for Clarks' on commission, while Clarks' paid for the soap used.

² The handle-house still stands over the Biss, with bricks omitted at intervals to allow free ventilation to keep the teasels pliable.

³ Patent No. 2539 of 15th September, 1801—with several diagrams.

This machine must have been driven at Clarks' by either hand or horse power up to 1815. The teasels were first set into handles or handlestocks which were then fixed in courses upon the face of the cylinders. In 1804 about 28 courses of handles (worth 4s. 6d. each) sufficed, but the needs grew steadily to 45 courses in 1815, and to 71 courses and 20 gross new handles in 1817. Three years later the purchase of 21 gross gig stocks (at about f1 a gross with teasels to match at f43 10s.) tells of a great change. During the next year gig-gear work and a second new gig (at £50) tell more of the replacement of Jotham's cumbersome dubbingmachine by faster steam-driven gigs. In 1822 Haden was paid £477 for two broad and two narrow gigs together with the necessary gear-work and for removing two narrow gigs. This steam-driven machinery with its greater speed and output led to an increased demand for teasels. During 1823 no less than 142 gross of gig-stocks and teasels (worth £433) were bought, and in December of that year the goods on the premises included more than 33 packs of 'King' teasels, over 101 packs of 'middlings' and about 36 packs of 'thousand ware', worth all told £681. During the years immediately following our survey a 'tell-tale' was added to the gigs, two broad gigs with extra large cylinders were installed, and a new teasel brush 'was fixed to a 'perpetual gig', and a 'new raising machine' purchased. In 1831 a perpetual broad gig was acquired for £60.

The teasels (Dipsacus fullonum L.) were obtained from the great producing area in Somerset near Blagdon, Harptree, Curry Mallet, and Hatch Beauchamp, where they may be seen in cultivation to this day. The 'Kings', or large teasels from the central top branch of the plants, were picked first; the 'middlings' or middle-sized heads next and the smaller heads or 'thousand ware' last. As a rule they were gathered in 'handfulls', 30 of which went to a stave or staff, and 30 staves to a pack of about 20,000 heads. The price varied greatly and was liable to sudden increases if the harvest proved very wet or the demand excessive. 'King' teasels fetched £4 a pack in 1815, £9 12s. 6d. in 1817 and £2 in 1820. When Clarks' began raising with a steam-driven gig they bought chiefly 'middlings', which were always the pick of the crop and usually twice as expensive as 'Kings'. In 1820, middlings were worth £4 a pack, but

soared to £8 a pack in 1821, only to drop again to £4 in 1824.

Shearing

From 1804 to 1808 the shearing shop at Clarks' contained two shearboards, 20 pairs of shears, ranging in weight from 29 lb. to 41½ lb. each, and shear leads weighing all told 375 lb. The shears were bought by the lb., the four newest costing at 1s. 3d. a lb. just over £2 10s. each. For shearing the cloth was fixed to a board and then the pair of shears and heavy shear leads laid flat upon it, the back of one blade of the shears resting on or against the heavy leads. The edge of the free blade was then pushed by means of a simple lever or by direct hand-thrust against

¹ Yet the sundries in December 1823 included 35 packs 32 staves of 'thousand wear' which makes it appear that the traditional measures were not always applied to the smallest teasels.

the fixed blade so shearing the intervening nap. In 1816 when the Clarks re-instituted a shearing-shop after it had lapsed for several years, the process still remained much the same. They acquired 9 pairs of shearmen's brushes, a pair of shearboards complete with leads, 4 pairs of shears from Randall of Westbury and 26 pairs from Hooper of Stroud and 11 frames from Samuel Harmer & Co. of Sheffield. These frames, with carriage, setting up and various additions, cost Clarks' nearly £481. In 1817, four more frames were bought from the Sheffield firm and by 1823 nine more had been obtained from various sources together with 34 pairs of shears, some of which weighed 60 lb. each.

These purchases show that Harmers' shearing-frames, although worked by steam-power, utilized the same shears and much the same methods as did the old hand-shearboards. They cut the cloth transversely or from list to list. The change to the more efficient continuous and longitudinal cutting occurred in 1825, when Clarks', having sold three frames to Lasbury for £20 each and three to Wilkins for £15 each, themselves bought a 'cassimere horizontal and three cross-cutters with covering' for £440. In the following year one of these cross-cutters was sold to Cooper Bros. of Trowbridge (for £106) and replaced by a Davis' broad horizontal cutter at £152.2 Within the next two years Clarks' bought 21 new cutters of various makes but no specific mention is made of Lewis' machines until 1830 when two were bought at £72 each. By 1839 these same machines had dropped in price to £24. Probably all the horizontal and cross-cutters mentioned could cut cloths from end to end and from list to list and were worked by blades rotating on a lawn-mower principle.

Brushing, Picking and Drawing

In 1804 the passing shops at Clarks' contained a scrave,³ a number of passing tables or boards on trestles and a set of brushing rollers. The processes involved cleansing the cloth of all loose nap, inspecting the cloth minutely and drawing or darning any flaws and weaknesses thereby detected. The brushing was done by hand-power until 1817, when a steam-driven machine, bought from S. King for £12, was obtained. In 1820 another brusher was purchased and in the following year a new set of brushes was acquired for £20 7s. Great progress was made in the nature and speed of brushing machines shortly afterwards. In 1825 a 'Jones's new patent brusher', worth £139 10s., was installed, and in 1829 two more were obtained for £97. In this same year the mention of another new brusher with a 'cast-iron frame' is the first we hear of the future supercession of the carpenter and blacksmith by the iron-moulder.

 $^{^{\}rm r}$ A pair of shears of this date survives at the mill; another has been lent to the Rosebank Museum, Halifax.

² The first great improvements in shearing-frames were made by John Lewis of Brimscomb, Stroud (Longitudinal cutting. Patent No. 3945 of 1815); and by J. & W. Lewis & William Davis, all of Brimscomb (Rotatory cutters. No. 4196 of 1818). The credit given to Davis by John Clark is remarkable, as Davis quarrelled with Lewis and set up a rival concern in Leeds.

³ Or 'scray', a low slatted stand on which cloths can be stacked.

In 1831 the acquisition of an Everett's brusher (for £48) reminds us how much Western manufacturers did to perfect such machines, for Jones came from the Stroudwater of Gloucestershire and Everett was the chief clothier of Upton Lovell and Heytesbury.

Of the drawing and marking of brushed cloths little need be said except that Mrs. Clark, with a lifetime's experience in the trade, at first saw to the work. In 1807 she was being assisted by a Mrs. Crab and a young girl, Jenny Davis. This maiden seems gradually to have taken over most of the drawing, whereupon she became Jane Davis, and, after her marriage in 1823, Jane Little.

Pressing and Packing

Fine cloths were always pressed with the greatest of care. From 1804 to 1808 the Clarks used a press capstan, under which the cloth was carefully folded with thick paper plates between each layer. In 1816 a new press kiln and a large stock of new press papers were acquired. Within a few years the Clarks determined to begin using steam on the cloths during the pressing, as this method gave a much better finish. In 1823-4 a pipe apparatus was erected to steam the cloths, the press-shop was altered, hot rollers were bought from Martin & Rolf's and a cistern and machinery for steaming cloths was made by George Haden for £25. On 30th June, 1824 John Clark wrote to George Kendall, his London agent and advisor, to say that 'we expect to try the hot water process tomorrow, or next day'. Later reports show that the results proved excellent.²

The cloths when ready for dispatch were enclosed in white paper and a stout packing of brown paper. In 1822 at least 5 cwt. of brown paper (at 45s. a cwt.) were used and the consumption in 1824 must have been almost as great.

WATER-SUPPLY

The Stone Mills and Studley Mills of John and Thomas Clark stand beside the little river Biss which runs very low in time of drought. The two brothers early improved the water-supply. Thus by stanking the river they furnished a river-trough for general purposes. They also erected large water-cisterns presumably for storing rain-water. A piece of land in Duke Street, which they bought in 1814, carried a reservoir, which was altered and stoned in 1820. When the steam-engine was being installed, the Clarks decided to sink a well on the new property and on 4th May, 1814, asked Harris, the sitting tenant, whether this could be done before the purchase was completed. Harris proved very awkward and said that 'it required consideration'. However, the well was eventually sunk and walled and furnished with a pump. From an entry made in the accounts for 29th December, 1845, we know that it was

In the accounts for 1825.

² Letter copied into Note of Hand Book.

126 feet deep and held 91 feet of water, or sufficient to keep the pump at work for 13½ hours.

POWER

Up to the year 1815 the Clarks worked their machines either by handor by horse-power. John Cooper, one of their local rivals, had installed a steam-engine in 1805 and others followed his example. On 7th April, 1814 the Clarks thought it 'necessary to erect a steam engine which with Steam House would cost upwards of £800'. They sent a letter to Watt inviting him to visit them. Watt sent Haden, one of his ablest assistants, in place of himself, and it was Haden who supervised the installation of the engine. There was much trouble before this was done, as Harris would not leave the new premises the Clarks had bought. On 21st December, 1814 the Clarks complained to their solicitor that it would be three or four weeks before the steam-engine could be at work. The parts were lying some in the yard and some at the wharf, and the engineer stated that the engine, worth £1,000, was deteriorating. Before September 1815 the engine was duly installed, as the following entries show:

	£ S. C	Τ.
'Boulton, Watt & Co. pr. 10 horse power steam engine	873 11	0
Godby & Co. for carriage of do.	6 16	6
Britten for do. from Birmingham to Marsh	33 19	0
Stone for foundation of engine	25 10	0
Hayden for erecting engine and living	30 O	0
Sundry men helping do.	9 2	6
Cockey. For iron plates before boiler	5 0	ο,

The reference in the accounts to 'Hayden' proved of the greatest significance, for Haden liked Trowbridge, and seeing endless possibilities of business there decided to make it his home. He immediately founded his own engineering business, which, as G. N. Haden & Sons Ltd., survives to this day. Haden was an inestimable blessing to the Trowbridge woollen manufacturers, who kept him busy mending 'gaskins', bolts, copper rims and bigger breakages, as well as supplying engines and elaborate machinery of all kinds.² The Clark accounts include engine expenses for the years 1845-1857, when the steam-engines (probably three) now developed over 50 h.p.³ In 1847, in addition to numerous minor repairs, the expenses included cleaning the boilers on Whit Monday and Tuesday—when 4 men put in a total of 114 hours at 3d. an hour and drank 3 gallons of beer at 1s. 4d. a gallon (total £1 12s. 6d.); and replacing the beam of the engine which broke on 10th July—but 'Haden lent us a new one and set it to work'.⁴

³ In 1833 Thomas Clark told a government commission that he used 50 h.p. steam. Reports of Factory Enquiry Commission, H.C. (450) 1833, XX, B.1, 96.

¹ Cockeys, then iron founders, and to-day still in business in Foundry Lane, Frome.

² In 1839 there were 19 mills in Trowbridge, containing all told 20 steam engines, totalling 348 h.p. Returns relating to Factories, H.C. (41) 1839, XLII, 152-61.

⁴ Other details, including recent developments, will be found in *The Steam Engineer*, XIII (May 1944), 242-6. A model of the old beam engine exists in one of the counting houses.

The entries concerning the consumption of coal are not as detailed as we would have wished. Inter815, 52 tons of coal at 24s. 6d. a ton were in stock and another 114 or 115 tons not yet paid for. It is doubtful whether the stock-in-hand represented a fortnight's supply, as Benjamin Gott at Leeds, with a slightly larger engine, used nearly 6 tons of coal a day. The price of large coal had dropped to 20s. 3d. a ton by 1818 but thereafter the Clarks seem to have used small coal which usually cost only 11s. a ton at the wharf and about 12s. 9d. at the factory. This low price must be attributed to the rising output of the Somerset coalfield and the cheap transport by canal to Hilperton wharf. Some cloth-making centres in the West Riding paid much higher prices for coal than Trowbridge did.¹

FACTORY BUILDINGS

The early nineteenth century was the great age of factory building at Trowbridge as was inevitable with the concentration of most manufacturing processes into the mills and the introduction of elaborate power machinery. Several large factories arose in the town at this time, while the Clarks extended their property by extensive purchases of houses and land situated a short distance from their Studley mills. On 7th April, 1814 the brothers began proceedings with a view to buying the property of the late Mrs. Cook in Duke Street, and for that purpose wrote to Joseph Butterworth, M.P., who had a counting house in Fleet Street.² Butterworth had already hinted 'that the payment might be made by instalments' with himself 'holding the writings and 5 per cent paid for interest'. The Clarks informed him that an experienced builder had valued the property at £2,195 and that they would have to spend upwards of £800 on a steam-engine and engine-house and £600 on extra machinery. They offered £2,300 for the premises, but asked for £2,000 of this to remain unpaid for a few years at 5 per cent, with the premises as security. would then need to take only £1,700 out of trade. Butterworth readily agreed and John Clark visited him at Fleet Street. The property, however, consisted of many buildings and tenements let and sub-let on varied tenancies, and a long complicated struggle ensued before all the tenants saw fit to leave. To complicate matters Cooper had built one of his side-walls actually on the Clarks' new property and John Cook and Mrs. Clark held a life interest in the premises by Copy of Court Roll of the Manor of Trowbridge of 1st November, 1773. Some of the tenants proved remarkably awkward. Robert Marshman, who used part of a tenement for the cloth trade, one week before 25th December, the last legal day of his occupation, began 'doing things in a very strange way . . . he is taking away the joists and floor which he says he put and purposes to leave only the bare walls. He says it will then be better

¹ Gott at Leeds paid 6s. 8d. a ton but at places such as Saddleworth it was 14s. to 15s. a ton. Minutes of Evidence relating to the Woollen Industry [1800], H.C., 1799-1800, CIX, 21, 34.

² The correspondence is copied into the Note of Hand Book.

than he found it'. Not until 3rd May, 1815 did Marshman call with the key, whereupon John Clark' told him the impropriety of his conduct'. Six years later—on 22nd December, 1821—the last £1,000 owing to Joseph Butterworth, M.P., was paid off, and in spite of delay, because Timbrell the Trowbridge solicitor was laid up with gout, the conveyance was completed in time for Clarks' annual stocktaking.

During the intervening years an engine-house had been built and the Duke Street property greatly improved in many other ways. In addition, two pieces of land had been bought from Charles Walker. In 1821-2 a large and a small wool-house were built, while in 1823 shops were completed on the site of a dung heap. Later records reveal the erection and enlargement of a new factory (for £196 12s.) in 1825; another new factory and a stove and tucker house (for £381) in 1828; a new factory (for £617 11s.) in 1835; a brushing and mule shop (for £423 14s.) in 1837; and various new shops over steam (for £610) in 1840. With the introduction of the power-loom further extensions were made.

CLOTHS

The type of fabric made at Clarks' between 1804 and 1824 showed surprising changes, annual and periodical, but the main production always was wool-dyed narrow cloths. These included cassimeres or cashmeres,² in which the woof and warp were usually spun to much the same fineness and to which a diagonal ribbing was given in weaving. This fabric was patented by Francis Yerbury of Bradford on 26th August, 1766, two species being specified, 'one quilled in the weaving with a flat whale, the other with a round one, which may be directed to any point, the threads of both chain and shoot crossing each other in a transverse manner . . .'.³ Cashmeres varied much in quality and size but were as a rule 42 yards or more on the loom and 35 yards to 38 yards when finished, although pieces of 55 yards are recorded. They were in constant demand for trouserings and light suitings.

Most of these, and other narrow cloths woven with a simpler weave were heavily milled, as the terms drab milled, mixture milled and blue milled testify. The blues were usually is. to is. 6d. a yard dearer than the drabs and mixtures, which in their turn were slightly dearer than the buffs, but all were good class fabrics selling normally at from 7s. up to ios. a yard.

Clarks' made relatively few broadcloths and those that were made were nearly always superfines. They cost as a rule about double the price a yard of high class narrow pieces, or 15s. to 20s. a yard, and when milled were from 16 yards to 20 yards long. They were unimportant from 1804 to 1809, and almost or quite absent from then to 1816, after which their output increased greatly in number and variety.

- ¹ Gas and gas-fittings were installed in this year, costing £64 6s.
- ² Sometimes corrupted into kerseymere.
- ³ Patent No. 858 of 1766.

The qualities, varieties, colours and prices of the fabrics produced may be judged from the wool used in the pieces and from the details of pieces resting at the agents. Up to 1806 cassimeres at 8s. to 9s. a yard greatly predominated, but in 1804 some duffels were made. These were cheap utilitarian cloths with a thick shaggy nap always in demand for overcoats and seamen's garments. The entries for 1806 show that a piece-dyed cassimere sold at 6s. a yard, or 9d. a yard cheaper than the wool-dyed variety.

In 1807 a few broads were made, especially black, which at 10s. 6d. a yard seems remarkably cheap. In the following year blue milled was in great demand, while the remnants included a toilenette which was usually made of a wool-cotton mixture. In 1809, when Spanish wool was so scarce, superfine blacks were selling at 20s. a yard, while superfine blues were at the phenomenal price of 30s. The great shortage of Spanish wool and the enforced use of English fleeces no doubt also affected the quality of many cloths produced. 'I had a letter from R. B. & Co.', wrote John Clark to his brother in the August. 'They say they received the 14 Blues, but think we picked out the worst, and would look them over in a few days and let us know. I wrote to tell them the contrary and would change any they disliked. . . .'2

From 1810 to 1813 the Clarks went in extensively for cords—Bedford, Regent, Union, Princes and Oxford at 7s. 6d. to 9s. 3d. a yard—which with much wool-dyed drab milled and medley cassimeres occupied almost all their attention. These cords seem a new line and presumably

explain the purchases of cotton and the presence of cotton list.3

From 1814 to 1816 drab, blue and mixture milled almost replaced other cassimeres and union cords. There was, too, a marked expansion of damson and purple dveing and in superfine broads, the blue Saxons (or Saxonies) fetching up to 21s. a yard against 17s. 6d. for greens, and 16s. 6d. for olives and browns. During the next two years superfines increased still more in number and brilliance-claret, corbeau, red, yellow, pink, electorate, woaded and olive ladies being among the significant designations. In 1819 Oxford and Anglesea mixtures were in the vogue, but superfine broads, especially Saxony or Electoral blues, came back again strongly in the following years in spite of the introduction of Wellington mixtures. In 1822 striped and ribbed cloths were much in evidence, while soon afterwards kerseys—narrow ribbed cloths selling at 7s. 6d. a yard—put in an appearance. These years show strongly the beneficial influence of Saxon fleeces; superfine broads were made in considerable numbers, and the quality of all cloths, including kerseys, had been much improved both by the use of the best broadcloth wool ever grown and by the excellence of the new machines and finishing processes. John Clark spoke with good reason when on 2nd July, 1824 he told George Kendall: 'We have reserved a few pieces of Drab Milled

¹ Or wool-silk as at Devizes and Salisbury: a fabric much used for waistcoats.

² Loose letter.

³ Cords were as a rule ribbed longitudinally.

excellent colours and quality, and we think we never had better than are now coming round.'

The variations in the selling price of cloths may probably be best judged by studying the average or normal price per yard of drab milled during this period as given below:

```
1804-8: 8s. to 8s. 6d.; 1809: 10s. 6d.; 1810-12: 8s. 9d. to 9s. 2d.; 1813-14: 9s. 6d. to 9s. 8d.; 1815: 9s.; 1816-19: 8s. to 8s. 4d.; 1820: 7s. 6d.; 1821-4: 7s.
```

MARKETS AND MARKETING

The Clarks sold the bulk of their pieces on commission to retail merchants in London. In addition some sales were made locally and to Bristol merchants. The local sales seemed to be direct to tailors judging from the number of remnants present at each stocktaking. The names of the merchants change rapidly during the twenty years under survey; altogether about 80 different retailers were dealt with, and in a mass of new partnerships and new firms only George Kendall and William Mercer (as W. & G. Mercer) appear throughout the period.

Most of the firms mentioned managed shops or warehouses in London. R. & T. Southeys dwelt near the Monument; Glendenings and Jos. Dunn both had businesses in Basinghall Street. Yet some of the merchants were local firms who presumably had shops in the metropolis: Carrick & Maclean, a London firm, ran a factory at Trowbridge. The well-known partnership of H. & G. Sheppard, relatives of the Clarks, were established at Frome. Yerbury and Applegate figured prominently in the cloth trade at Bradford-on-Avon. Overbury & Cartwright (1820) recalls Nathaniel Overbury, the noted cloth-maker of Westbury. John Lane was definitely of Bristol, as no doubt were a few of the other retailers. At stocktaking in 1804 the Clarks had pieces 'resting' at only four London agents, whereas in 1824 they were using at least 19 retailers as well as their own London premises.

In 1824 a London retail house was acquired with the willing assistance of George Kendall who, having been a retailer for Clarks' for 20 years, was now a most trusted friend. The two brothers aimed at a warehouse in a respectable neighbourhood at about £60 a year and would not 'like to take a lease particularly for the first year should we have to pay for the water-closet. Cloth stands of course we must put up . . .'. They also began to study Trade Cards and invoice headings to see how they liked them. After considering several places, they secured 70 Basinghall Street, on 1st July, 1824. Some excellent drab milled pieces were sent up 'that our commencement will be well'', and black superfines and a variety of cloths followed 'as an assortment will add to general sales'.

if the Note of Hand Book. In 1830, the account book reads 'To Valuation and fixtures in No. 2 Basinghall Street, £65 178. od.', so presumably the premises were changed at this time.

The last letter to George Kendall concerning the purchase concludes: 'We hope you are painting the warehouse but do not put our names up till our Mr. C. is there.' The sum of £32 15s. 2d. was spent on painting and fixtures, and about mid-July the name of John & Thomas Clark adorned their new foothold in the metropolis.

TRANSPORT

Apart from wool and some machinery, the main sources of raw materials used at Clarks' were fairly near at hand. Teasels and coal came from Somerset, soap, oil and most dyestuffs from Bristol and certain minor scouring agents from Trowbridge itself. Spanish wool came from both London and Bristol but Saxon wool probably came entirely from London. Trowbridge was well situated on the main London-Wells thoroughfare at a distance of 98½ miles from Hyde Park Corner. The route to Bristol was more circuitous and was about 26 miles.

Many details on the transport of wool are given in the accounts. From 1804 to 1806 most of the Spanish wool in store came from Bristol at a cost for carriage of 1s. 9d. to 1s. 11d. a cwt. or \(\frac{3}{4}\)d. a cwt. a mile. In 1811 carriage on Spanish wools from Bristol was 2s. 6d. a cwt. and from London 6s. to 7s., the latter working out at \(\frac{3}{4}\)d. a cwt. a mile. In 1820 of the wools in store 39 bags had come from London for \(\frac{1}{2}\)o 2s. (or about 5s. a cwt.) and 169 bags from Bristol at \(\frac{1}{17}\) 3s. or 1s. a cwt.

In 1822 carriage from London was 4s. a cwt. while the Bristol rates remained unchanged. In the following year carriage from London by water cost 2s. 7d. a cwt. against 5s. a cwt. by land.

This use of cheap water transport was a great boon to Trowbridge manufacturers. The Kennet and Avon canal, which was opened on 28th December, 1810, gave a fairly direct water-route to London and in the Bath direction linked up with the Somerset coal canal, permitting coal to come cheaply to Hilperton Wharf within a mile of the Trowbridge mills. The canal was much used for any bulky products. In December 1814 the steam-engine bought from James Watt came by water from Birmingham to Hilperton Marsh for £33 19s., whereas the mile or so carriage by cart from the wharf to the mills cost £6 16s. 6d. Similarly the 11 shearing frames bought in 1816 from Samuel Harmer of Sheffield cost only £24 to reach the mill, which was cheap enough for a journey of about 200 miles.

Cloth probably always went by road, as water-carriage was slow and liable to delays. On 2nd July, 1824 John Clark asked George Kendall to 'return No. 52093 by first waggon, as we can get 6s. 3d. for it. You have one piece of Drab Milled to the three patterns sent now by waggon'. As for correspondence it was quite common for one Trowbridge manufacturer to take and bring back letters for another, and each seemed remarkably well-informed of the visits of his neighbours.

¹ A distance probably of at least 120 miles. For local canals see Joseph Priestley, Historical Account of the Navigable Rivers, Canals and Railways of Great Britain (1831) 353-60, 580-2.

STATE OF TRADE AND PROFITS

The state of the woollen trade as far as the Clarks were concerned may be judged on the total profits gained in a year, the number of cloths made, the drawbacks allowed on soap and the amount of capital in the business. The actual profit earned each year is stated clearly in the annual stocktaking, the only difficulty being in 1823 when the very small profit (of £642) is largely explained by a debt of £4,528 owed by George Mercer. The number of cloths produced must be roughly proportional to the drawbacks—or return of tax—allowed on soap, but it would be unwise to carry the relationship to minute figures. The number of pieces made annually can be calculated very approximately from the numbers given to the finished cloths and lots of varn but the calculation is much more involved than appears at first sight. The calculations, too, should take into account the fact that John Clark added 10,000 to the piece numbers in 1807, while in 1800 the results seem too low to be trustworthy. There is, however, no doubt about the output after 1814 when Thomas Clark was allowed a commission of 1s. a piece up to 1820 and 1s. 6d. a piece The money or total capital in the business is shown clearly enough at each stocktaking, while the main additions to the fixtures and premises after Christmas 1815 are also stated in a manner which allows them to be distinguished from the general account. The main conclusions to be drawn from these various statistics is that the business grew steadily

	Annual Profits	Output of Cloths	Money in Trade	Expenditure on Premises, etc.	Drawback on Soap	Value of Wool in Store

	<u> </u>	<u> </u>	<u> </u>	<u> </u>	<u> </u>	<u> </u>

from a capital value of £1,600 to £50,000 in twenty years and that the cloth output rose from 300 pieces to 5,000 pieces, and the profits from £500 to well over £7,000 annually in the same period. The statistics are tabulated in the table given above, in pounds sterling to the nearest pound and in pieces of cloth, with the addition of figures concerning the value of wool in store at each stocktaking.

The fluctuations in trade are of considerable interest. From 1806 to 1809 trade was very difficult both for Clarks' and their agents, and in 1807 John Clark took the precaution of buying a copy of the Bankrupt Laws which he henceforth kept in the counting house. Sales and profits improved greatly from 1810 to 1812 but declined somewhat in the following year, owing partly no doubt to the fact that so many pieces were almost finished but not yet ready for the market. Trade was good in 1814 and 1815 but dropped appreciably after the close of the Napoleonic Wars with a marked decline in prices of cloth. Thereafter the increasing output of cloths and ample supply of high-class wools more than offset the drop in the market value of the fabrics. From 1818 to 1824 between 60 and 80 cloths were produced each week and the profits averaged from \$\int_{100}\$ to \$\int_{150}\$ weekly.

This happy state of affairs should be set against the oft-quoted statements in the Assistant Commissioners' Reports on Hand-loom Weavers in 1840. There it is said that 'twenty three years ago the whole of the preceding great clothing district was in its most flourishing condition', but that in 1816 trade began to stagnate and 'since 1820 it has retrograded '. There seems no doubt that the witnesses usually did not realize the extent of the concentration of the industry into factories and how the cloth-output was being maintained by fewer and fewer machines and by fewer and fewer workers. The output of cloth was not in fact decreasing and the quality of the pieces was improving markedly. Towns such as Trowbridge were now gathering up the manufactures that once occupied the people of a score of neighbouring villages,2 and the profits obtained by these urban manufacturers are amply demonstrated in the Clark records. But the closing of mills less fortunately located and less skilfully managed is revealed in the occasional purchase by Clarks' of secondhand machines, as for example from Fordingbridge, Hants, where linen and sailcloth were replacing woollens.

The subsequent history of Trowbridge in general and of Clarks' in particular bears out the contention that the concentration greatly benefited certain towns. Trowbridge underwent a remarkable expansion in the early nineteenth century. Besides the building activities of John and Thomas Clark, factories were newly built or much enlarged by James

Trowbridge steeple, Long and leetle, Dirty town And nasty people.

I Report from Assistant Hand-loom Weavers' Commissioners, H.C. (43(I)) 1840, XXIII, 1-8.

² This perhaps helps to explain the conventional dislike of the people of the surrounding villages for Trowbridge. As this verse testifies:—

Edgell, Clark & Perkins, Samuel Salter, Samuel Pitman and John Stancomb¹ while Edward Cooper at Staverton continued the creation of a new village which in time became a separate parish. In fact, the growth of Trowbridge from 5,799 people in 1801 to 11,146 in 1851 was the outstanding feature of the 'industrial revolution' in Wiltshire.

By 1861 the Clarks' mill property and machinery alone was valued at £15,712 and consisted of the following premises: a large factory in Duke Street with Engine house, etc., and 12 rooms or shops; a small factory of 9 rooms; a new factory of 9 rooms; the Counting House factory of 18 rooms or shops; picking shops of three floors; Studley Mills with Engine house, etc., and 7 large rooms, including a power-loom shed; Stone Factory with 8 shops; No. 2 Mill with two floors; No. 3 Mill with two floors and a pothouse; two fulling mills and a fulling mill building; a stable and 6 other shops or 'houses'.

By 1884, when the business was concentrated upon the Studley site and large new buildings erected, the capital value of the premises and

machinery exceeded £20,000.

To-day the Trowbridge woollen industry continues to flourish and, as at the opening of the twentieth century, five firms are engaged on a wide variety of woollens. Among these are John & Thomas Clark Ltd. In July 1942, when an enemy bomb demolished the dyehouse of Kemp & Hewitt, the blast did slight damage to Clarks' counting houses but not sufficient to perturb the fine portraits of John and Thomas Clark who still look across a room at the medals and diplomas won at various Great Exhibitions. Nor for that matter did it disturb the solidity of the counting-desk which they purchased for less than £10 one hundred and forty years ago.

NATURE OF THE CLARK RECORDS

The following manuscripts and printed book dealing with the woollen affairs of the Clark family have been found by Miss G. F. Clark among the family and business documents. She herself can remember when certain of the documents were more complete, but there is little hope that new documents may be uncovered.

- 1. Pattern books (6 in number), 1706-96.
- 2. A Batt or dye book, with patterns and recipes, 1756-9.
- 3. Order Books with breaks and interruptions through loss, damage, etc., back to about 1720; the main breaks are 1826-31, 1834-7 and 1839.

¹ See details of each firm in Reports of Factories Inquiry Commission, H.C. (450) 1833, XX, B.I, 90-102; Supplementary Report of Factories' Inquiry Commission, H.C. (167) 1834, XX, B.I, 94-106.

- 4. Memoirs of the late Reverend John Clark, written by himself, and at his request published with remarks by William Jay (1810). This small printed volume begins with a brief reference to John Clark's birth in 1745 and his early life and then continues in diary form to 1807 (70 pages), and concludes with Jay's estimate of John Clark and some of Clark's poems, etc. (100 pages).
- 5. STOCK BOOK for period 31 December 1804 to 31 December 1813. Foolscap, with water-mark of Britannia. 93 sheets or 186 pages beautifully written.
- 6. Stock Book for period 26 December 1814 to 26 December 1824. Foolscap size; strongly bound in vellum. 280 sheets or 560 pages. Water-marks of C. Brenchley, 1812; C. Wilmott, 1812; and D. & Co., 1813. Bought from John Williams, 20 Cornhill, London. This volume also enumerates the main additions to premises and machinery 1815-1841.
- SMALL NOTE OF HAND BOOK: 6 inches by 7½ inches: bound in pigskin. Water-mark 1821. Contains at back valuation of machinery, etc. 1861-92 (113 pages); at front, sales of cloth by pieces 20 June 1823 to 7 July 1826 (12 pages) and amounts spent on steam engine and pump 28 June 1845 to 1 November 1858.
- 8. SMALL NOTE OF HAND BOOK, similar to above, but in better state. Correspondence with Joseph Butterworth, M.P., about new premises and insurance (7 April 1814 to 22 December 1821) occupies first 36 pages. Correspondence with George Kendall over new London shop (28 May 1824 to 5 July 1824) occupies next 8 pages. Cash account of W. P. Clark and other members of his family 1878-97 occupies 155 pages.
- 9. Four Family Letters (1787-1853); Bill of Sale of Wool Auction at Garraway's, 22 March 1810; Agreement between John and Thomas Clark, 5 October 1801.
- 10. A TYBURN TICKET (1818) AND DEED OF CONVEYANCE OF IT to Thomas Clark (23 March 1818). The ticket was as follows:

THESE ARE TO CERTIFY that at the Assizes and General Gaol Delivery held at New Sarum in and for the County of Wilts on Saturday the seventh day of March instant John White was convicted before me whose Name is hereunto subscribed one of His Majesty's Justices assigned to deliver the Gaol of the County aforesaid of the Prisoners therein being of Burglariously breaking and entering the Dwelling House of John Rawlings at the parish of Trowbridge on the fourteenth Day of October last and stealing therein the goods and Chattels of the said John Rawlings of the value of twenty three pounds————

AND these are also to Certify that the said John Rawlings did apprehend and take the said John White and did prosecute him so apprehended and taken until he was convicted of the Felony aforesaid. Whereupon for a Reward unto the said John Rawlings by virtue of an Act of Parliament made in the tenth and eleventh Years of the Reign of his late Majesty King William the Third in that behalf he the said John Rawlings or his Assignee is intitled to be and is hereby declared to be

discharged of and from all manner of PARISH and WARD OFFICES within the Parish aforesaid wherein the said Felony was committed GIVEN under my Hand the eleventh day of March in the Year of our Lord one thousand eight hundred and eighteen.

(Signed) G. S. HOLROYD.

On the 23rd March, 1818, John Rawlings 'cloth dresser of Trowbridge' transferred the ticket and all rights appertaining to it to Thomas Clark for the sum of £41.

11. An inventory of Workpeople employed by Clarks'. Several large sheets, with water-mark 1831. Obviously a copy of the 'form' which Thomas Clark told the Commissioners in 1833 that he had delivered.¹

The manuscripts which have been selected for reproduction (Nos. 5 and 6) and those which concern them most intimately (Nos. 7-10) are shown above by capitals. The two main stock books are meticulously compiled, every item being checked each year. The pencils vary in number yearly; the paper in store changes in quantity; the gum and sealing wax decrease with use. The book-keeping is almost faultless but there are signs of checking by a professional, who occasionally offered advice on the methods of accountancy as pencilled jottings indicate.

METHOD OF EDITING

The accounts for 1804 and 1805 have been transcribed in full.

The accounts from 1806 onwards have been abridged on the following plan. First, individual items in a house or shop often recur from a previous year or years. Where this has happened, only the total value of the contents has been given, though with the addition of a back-reference for the details. Secondly, only the totals of each group of lots of yarn have been given, though the number of lots in each group is indicated in brackets. From 1811 onwards a further abridgment has been introduced. The individual numbers of lots of yarn and pieces of cloth have been omitted, though the number of items in each batch has been indicated in brackets.

Full transcription is resumed with the account for 1824, except that the numbers, etc., assigned to individual pieces 'resting' at the various warehouses have been omitted. The highest number so given was 55562.

The wool-marks invariably drawn against each consignment of wool have been omitted, though most are reproduced in Plates I and II. In the final balance sheets of some years the 'credit' and 'debit' accounts succeed one another vertically instead of horizontally.

Subject to the foregoing reservations this edition is a transcription of the two Stock Books concerned.

Kidlington, March 1950.

(Signed only by John Clark & Thos. Clark.)

1814

April 22nd 1814 Purchased of Messrs. Butterworth & Thomas all those premises in Duke Street in Trowbridge late the property of Mrs Cook for two thousand five hundred pounds to be paid as follows—Five hundred pounds the 25th of December 1819. One thousand pounds the 25th of December 1819 and One thousand pounds the 25th of December 1821. The agreement for which purchase is made out in the name of John Clark only as well as of a certain piece of land adjoining the said premises (on which a reservoir is made) bought of Mrs Harriet Walker for two hundred & five pounds—but it is fully understood between us as a proof of which we have hereunto signed our names that this property with all monies laid out thereon of which an account shall be added to the purchase money & the total amount carried into each years stock as monies in trade & part of our capital therein & when our partnership shall be dissolved the proportion of our shares in the premises shall be in the same proportion as our monies bear to each other. The premises being intended to be as part of the capital in trade and each of our interest to vary in them as the Amount of our monies vary in trade.

John Clark Thomas Clark

STOCK TAKEN DECEMBER 26th 1815

September 5th 1815. It is intended from & after the Year 1814 to call all our Machinery, Dye furnaces, Implements in Trade &c. &c as fixtures to the premises which will be that much more valuable adding the different Bills for moving, altering & making the premises more complete and we have agreed in the sum of £4162.2^s.5^d to include the whole up to Xmas 1815 adding the purchase money as we pay it & to be continued as such in our Stock Book yearly as it will save much trouble taking Stock in future. Whatever addition may be thought worth adding will be done to the above amount encreasing it from year to year as circumstances may require.

INDEX OF SUBJECTS

NOTE

It will be observed that these accounts are divided into 'Sections', e.g. 'Counting House', 'Picking Shop', 'Wool Unopened and Tried'. The titles of these sections are printed in small capitals and are indexed below.

Where an object or process is mentioned repeatedly under one or more of these sections, the page number of its first occurrence is given in this index, followed by a general reference to the section or sections under which the item recurs. Thus the entry 'aqua fortis, 86. See DYE WAREHOUSE; DYEWOODS' means that the first reference to aqua fortis is on page 86 and thereafter it will be found under the Dye Warehouse and Dyewoods sections (q.v. in index).

This practice has been modified slightly in the case of sub-entries, etc., under the entries 'cassimere', 'cloth', 'cord' and 'oil', since the necessary further information will be found in the sections indexed at the heads of those entries. Thus, in the case of sub-entries, etc., under 'wool 'further information will be found under the sections 'Wool, Account of' and 'Wool Unopened and Tried'. Notwithstanding this, throughout the index the page numbers of any specially significant subsequent references have been added to the initial reference to sub-entries.
